# County-Level Trends in Vaccination Coverage Among Children Aged 19–35 Months — United States, 1995–2008

Philip J. Smith, PhD

James A. Singleton, MS

National Center for Immunization and Respiratory Diseases

## Abstract

**Problem/Condition:** Estimated trends in county-level vaccination coverage compared with national health objectives and associated with other variables (e.g., access to care, economic conditions, and demographic characteristics) have not been reported previously.

**Reporting Period:** 1995–2008.

**Description of System:** The National Immunization Survey (NIS) is an ongoing, random-digit-dialed telephone survey that gathers vaccination coverage data from households with children aged 19–35 months in 50 states and selected urban areas and territories.

**Results:** During 1995–2008, 185,336 children aged 19–35 months sampled by NIS had adequate provider data and lived in one of the 257 counties where the combined sample size for at least one of the seven biennial periods during 1995–2008 was  $\geq 35$ . Statistically significant increases in estimated vaccination coverage occurred in 27 of 233 counties (12%) with  $\geq 4$  doses of diphtheria and tetanus toxoids and acellular pertussis (DTaP); for 38 of 233 counties (16%) with  $\geq 3$  doses of polio vaccine; eight of 233 counties (3%) with  $\geq 1$  dose of measles, mumps, and rubella (MMR); nine of 233 counties (4%) with  $\geq 3$  doses of *Haemophilus influenzae* type B (Hib) vaccine; 193 of 233 counties (83%) with  $\geq 3$  doses of hepatitis B vaccine; 228 of 232 counties (98%) with  $\geq 1$  dose of varicella vaccine; and 187 of 192 counties (97%) with  $\geq 4$  doses of 7-valent pneumococcal conjugate vaccine (PCV7). Six of 233 (2%) counties had significant decreases in vaccination coverage for Hib. During the 2007–2008 biennial period, the percentage of 193 counties with estimated vaccine coverage that achieved the *Healthy People 2010* objective of 90% vaccination coverage was 8% for DTaP/DTP vaccines, 93% for polio vaccine, 86% for MMR vaccine, 71% Hib vaccine, 94% for hepatitis B vaccine, 50% for varicella vaccine, and  $<1\%$  for PCV7. Among 104 counties, the estimated percentage of children aged 6–23 months who were administered  $\geq 1$  dose of the seasonal influenza vaccine during the 2007–2008 influenza vaccination season was 39.0% (range: 22.2%–68.8%). For most vaccines and vaccine series, higher levels of county-level vaccination coverage correlated with a higher number of pediatricians per capita, a higher number of people living in group quarters (e.g., college residence halls, residential treatment centers, skilled nursing facilities, group homes, military barracks, correctional facilities, workers' dormitories, and facilities for persons experiencing homelessness) per capita, higher per capita income, a higher number of Hispanics per capita, and having a service-dependent economy. Lower levels of county-level vaccination coverage correlated with higher number of persons in poverty per capita, a higher percentage of black children among children aged  $<5$  years, higher levels of housing stress (i.e.,  $\geq 30\%$  income for rent or mortgage and certain inadequate housing characteristics), a higher number of pediatric intensive care beds per capita, and designation as a nonmetropolitan county with an economy dependent on recreation activities.

**Interpretation:** During 1995–2008, significant increases in vaccination coverage for individual vaccines occurred in many counties for the newly recommended vaccines, varicella and PCV7.

**Public Health Actions:** In counties that did not meet the *Healthy People 2010* vaccination coverage objectives, states should evaluate strategies to achieve these objectives. *The Guide to Community Preventive Services* provides a summary of interventions that increase community vaccination coverage, including provider reminder-recall systems that remind parents to return to clinics to administer missed doses to children and assessment and feedback on the performance of vaccination providers. In counties where significant decreases in Hib vaccination coverage occurred, additional research is warranted to determine whether the recent shortage in the Hib vaccine was the sole cause of these decreases. In counties with a high proportion of children living in poverty, interventions to increase vaccination coverage among these children are needed. Additional research is required to understand potential barriers to increased coverage with these vaccines, the role of vaccination providers and their resource constraints, and factors associated with access to health care among children.

## Introduction

County-level vaccination coverage estimates are important, both because public health issues often originate in small geographic areas and because certain public health actions are most effective at the local level. For example, a study conducted during 1996–2001 in inner-city locations in Atlanta, Georgia, found a high rate of unvaccinated children among racial/ethnic minorities living in the surveyed neighborhoods (1). In Sullivan County, New York, an investigation by the New York State Department of Health identified a mumps outbreak of among 31 persons (nine not vaccinated, 16 administered 2 doses, four administered 1 dose, two with unknown vaccination history) in a population with 96% vaccination coverage (2). Clusters of children who did not receive any vaccine doses were found in specific geographic areas, with the largest numbers of unvaccinated children living in counties in California, Illinois, New York, Washington, Pennsylvania, Texas, Oklahoma, Colorado, Utah, and Michigan (3). In Ashland, Oregon, 12.3% of all children attending public schools and 18.8% of children attending day-care facilities in 2002 claimed an exemption from mandatory vaccination laws, compared with 2.4% for the entire state (4,5).

Children of parents who refuse vaccine doses have an increased risk for acquiring and transmitting measles and pertussis (6), and in small geographic areas with a preponderance of children whose parents have refused vaccine doses, an increased risk for pertussis and measles exists among members in the community (6–8). In 2008, the index cases for three of four measles outbreaks in small geographic areas were in children whose parents had refused vaccine doses (9,10). Measles is not endemic in the United States, and index cases in the measles outbreaks were imported from other counties.

Although a particular state estimate of vaccination coverage might be high overall, geographic areas with underimmunized children can exist within a state when unvaccinated children or children with lower vaccination coverage live in the same geographical location. In this case, vaccination coverage in those areas might not be sufficient to inhibit the widespread transmission of a vaccine-preventable disease (11).

To characterize trends in estimated vaccination coverage among children aged 19–35 months in 257 selected U. S. counties, CDC analyzed 1995–2008 data from the National Immunization Survey (NIS) to determine achievement of *Healthy People 2010* objectives of 90% vaccination coverage for individual vaccines and 80% for vaccine series of certain routinely recommended childhood vaccines (12). Data were analyzed to identify increases and decreases in vaccination coverage among children aged 19–35 months in selected counties and associations between county-level vaccination coverage

rates and county-level indices of access to care, economic conditions, and demographic composition. Estimated trends in vaccination coverage in small geographic areas such as counties might assist local public health officials with determining the current and past level of vaccination coverage and whether the coverage is likely to increase or decrease if current trends persist. This type of information might help local public health officials improve vaccination coverage.

## Methods

NIS is an annual survey conducted by CDC to monitor vaccination coverage rates among U.S. children aged 19–35 months. During 1995–2008, NIS was conducted in all 50 states and the District of Columbia and selected urban areas. Data are collected in NIS in two phases. The first phase is a list-assisted random-digit-dialed telephone survey of households with landline telephones and an age-eligible child (aged 19–35 months). At the conclusion of the interview, the interviewer requests parental permission to contact the children's vaccination providers. The second phase is a mail survey of doctors and other vaccination providers named by the respondent when permission is given. In all survey years during 1995–2008, provider-reported vaccination histories obtained from the mailed survey were used to evaluate vaccination status. During 1995–2008, the response rate (13) of the telephone survey of NIS ranged from 65% to 76%, and the percentages of sampled children with complete telephone interviews having a sufficiently detailed vaccination history returned from vaccination providers to accept as a complete report ranged from 62% to 73%. The response rate of the telephone portion of NIS is the product of the percentage of telephone numbers sampled from NIS list-assisted sampling frame that were determined to be working residential telephone numbers, the percentage of sampled residential telephone numbers that were successfully screened to determine whether the household had children aged 19–25 months, and the percentage of sampled households with children aged 19–35 months that had completed the NIS telephone interview. Detailed descriptions of the statistical methods used by NIS have been published previously (14,15).

## Measures of Childhood Vaccination Status

In 2009, 10 vaccines were recommended for routine use among children aged 0–24 months (16). The Advisory Committee on Immunization Practices (ACIP) recommendations for routine administration of childhood vaccines were used to evaluate the vaccination status of sampled children for all seven biennial periods during 1995–2008, regardless of

vaccine shortages during which ACIP issued interim recommendations (Box 1). Sampled children were determined to be up to date with respect to selected vaccines if, by the date of the NIS telephone interview, they had been administered  $\geq 4$  doses of diphtheria and tetanus toxoids and acellular pertussis or diphtheria and tetanus toxoids and pertussis (DTaP/DTP) vaccine;  $\geq 3$  doses of polio vaccine;  $\geq 1$  dose of measles, mumps, and rubella (MMR) vaccine;  $\geq 3$  doses of *Haemophilus influenzae* type B (Hib) vaccine;  $\geq 3$  doses of hepatitis B vaccine;  $\geq 1$  dose of varicella vaccine;  $\geq 2$  doses of hepatitis A vaccine; and  $\geq 4$  doses of the 7-valent pneumococcal conjugate vaccine (PCV7) (Box 2). For a given survey year, sampled children aged 6–23 months were considered to be up to date for the seasonal influenza vaccine if they were administered 1 dose of the seasonal influenza vaccine during the most recent seasonal influenza season, unless they were not administered an influenza vaccine dose before the most recent influenza season, in which case they required 2 doses of the vaccine during the most recent influenza season (17). Other measures of vaccination coverage that were evaluated include  $\geq 3$  doses of DTaP/DTP,  $\geq 3$  doses of PCV7,  $\geq 1$  dose of the seasonal influenza vaccine, and  $\geq 1$  dose of hepatitis A vaccine.

### Sample Sizes and Number of Counties with Coverage Estimates

To ensure the confidentiality of survey information during each of the seven biennial periods (1995–1996, 1997–1998, 1999–2000, 2001–2002, 2003–2004, 2005–2006, and 2007–2008), vaccination coverage was estimated only for counties where the sample size of children with sufficient vaccination and health-care provider data from the mailed survey portion of NIS was  $\geq 35$  for the combined survey years during the biennial period and  $\geq 14$  for each year during the biennial period.

For each of the 257 counties (among the 3,141 counties in the United States) that met the sample size requirement for at least one biennial period, an averaged estimate over the biennial period was calculated. The estimate of the number of children aged 19–35 months as of July 1, 2007, living in the 257 counties was determined from U.S. Census data (18), as well as the rank of those 257 counties according to their population of children aged 19–35 months as of July 1, 2007 (Table 1). In addition, the number of counties for which estimates were reported for each biennial period and vaccine or vaccine series type were calculated (Table 2). Because the sample size in counties fluctuated from year to year, not all counties met the sample size requirement in every biennial period. If not achieved for a biennial period, estimates were reported for fewer than 257 counties (Table 2). During 1995–2008, 185,336 children

#### BOX 1. Biennial periods in which recommended childhood vaccines were included in the National Immunization Survey during 1995–2008

**DTP/DTaP:** 1995–2008\*  
**Polio:** 1995–2008  
**MMR:** 1995–2008  
**Hib:** 1995–2008  
**Hepatitis B:** 1995–2008  
**Varicella†:** 1997–2008  
**PCV7‡:** 2003–2008  
**Seasonal influenza§:** 2003–2008  
**Hepatitis A\*\*:** 2003–2008

\* Includes the following biennial periods: 1995–1996, 1997–1998, 1999–2000, 2001–2002, 2003–2004, 2005–2006, and 2007–2008.

† Varicella vaccine was recommended by ACIP in 1996. (Source: CDC. Prevention of varicella: recommendations of the Advisory Committee on Immunization Practices [ACIP]. MMWR 1996;45[No. RR-11].)

‡ PCV7 was recommended by ACIP in 2000. (Source: CDC. Preventing pneumococcal disease among infants and young children: recommendations of the Advisory Committee on Immunization Practices [ACIP]. MMWR 2000;49[No. RR-9].)

§ The initial 2002 ACIP recommendation for routine administration during the 2001–2003 season with 1 or 2 doses of influenza vaccine for children aged 6–23 months encouraged vaccination of this age group when feasible. (Source: CDC. Prevention and control of influenza: recommendations of the Advisory Committee on Immunization Practices [ACIP]. MMWR 2002;51[No. RR-3].) In 2004, ACIP recommended 1 or 2 doses of influenza vaccination for children aged 6–23 months. (Source: CDC. Prevention and control of influenza: recommendations of the Advisory Committee on Immunization Practices [ACIP]. MMWR 2004;53[No. RR-6].) Influenza vaccination coverage estimates in each biennial period represent an average of two influenza seasons (e.g., the 2003–2004 biennial period represents an average of the 2002–03 and 2003–04 influenza seasons as estimated by the 2003 and 2004 NIS data, respectively).

\*\* Hepatitis A vaccine was recommended by ACIP for routine administration in 2006. (Source: CDC. Prevention of hepatitis A through active or passive immunization: recommendations of the Advisory Committee on Immunization Practices [ACIP]. MMWR 2006;55[No. RR-7].)

#### BOX 2. Vaccine components of selected vaccine series

**4:3:1 series:**  $\geq 4$  doses DTaP/DTP vaccine,  $\geq 3$  doses of polio vaccine,  $\geq 1$  dose of MMR vaccine  
**4:3:1:3 series:** 4:3:1 plus  $\geq 3$  doses Hib vaccine  
**4:3:1:3:3 series:** 4:3:1:3 plus  $\geq 3$  doses of hepatitis B vaccine  
**4:3:1:3:3:1 series:** 4:3:1:3:3 plus  $\geq 1$  dose of varicella vaccine  
**4:3:1:3:3:1:4 series:** 4:3:1:3:3:1 plus  $\geq 4$  doses of PCV7

aged 19–35 months sampled by NIS had adequate provider data and lived in one of the 257 counties where the combined sample size for at least one of the seven biennial periods during 1995–2008 was  $\geq 35$ .

### Statistical Analysis

Coverage rates for the seven biennial periods were estimated using James-Stein statistical methods (19) to obtain estimates with greater precision. James-Stein estimates of vaccination coverage were obtained for each vaccine and vaccine series by averaging the two county-level annual estimates for each biennial period and then, for each biennial period, modeling the averaged estimates using multivariable regression as a function of 35 variables derived from the U.S. Department of Health and Human Services Area Resource File. Estimates were compared with the *Healthy People 2010* vaccination coverage objectives of 90% vaccination coverage for individual vaccines and 80% for vaccine series to determine which counties achieved the *Healthy People 2010* objectives.

Variables from the Area Resource File, including county-level indices of access to care, economic conditions, and demographic composition (Table 2), were used to evaluate the association between averaged county-level vaccination coverage rates and county-level indices of access to care, economic conditions, and demographic composition. Forward stepwise regression was used to select predictors among the 35 variables to explain variation in the log odds of averaged county estimates.

Among the 257 counties that achieved the sample size requirement for at least two biennial periods, trends were evaluated across time by comparing the difference of the James-Stein composite estimate for the earliest biennial period with the most recent biennial period. A *p* value of  $< 0.05$  from a one-sided statistical *z* score test was considered statistically significant.

Although comparison of the 1995–1996 and 2007–2008 biennial periods was preferred, certain counties did not have large enough sample sizes to protect the confidentiality of survey respondents during these periods. Therefore, the trend analysis included counties that met the sample size requirement for at least two biennial periods at any time during 1995–2008 (comparing the earliest and most recent periods), and the overall number of counties used to examine trends differed from the number of counties studied (Table 3).

## Results

### Representation of Selected Counties

During the 2007–2008 biennial period, a total of 20,552 children aged 19–35 months who were sampled by NIS had 1) sufficient provider data returned from the mail survey sent to the vaccination providers of the sampled children and 2) lived in the 193 counties where the sample size was  $\geq 35$  for the combined years and  $\geq 14$  for each survey year. During the 2007–2008 biennial period, the percentage of children aged 19–35 months living in these 193 counties comprised 49% of all children aged 19–35 months living in the United States. County-level estimates from the 2007–2008 biennial period includes 106 of the 150 counties with the greatest number of children aged 19–35 months as of July 1, 2007, as estimated from U.S. Census data.

### Estimated County-Level Vaccination Coverage for Individual Vaccines During 2007–2008

During the 2007–2008 biennial period, estimated vaccination coverage ranges were as follows for individual vaccines:  $\geq 3$  doses of DTaP/DTP ranged from 91.1% in Clark County, Nevada, to 97.4% in New York County, New York (Table 4);  $\geq 4$  doses of DTaP/DTP ranged from 72.2% in Clark County, Nevada, to 95.6% in Grafton County, New Hampshire (Table 5);  $\geq 3$  doses of polio ranged from 86.8% in Pierce County, Washington, to 96.8% in Washington County, Rhode Island (Table 6);  $\geq 1$  dose of MMR ranged from 86.4% in Clark County, Nevada, to 96.6% in Suffolk County, Massachusetts (Table 7);  $\geq 3$  doses of Hib ranged from 79.2% in San Juan County, New Mexico, to 96.5% in Suffolk County, Massachusetts (Table 8);  $\geq 3$  doses of hepatitis B vaccine ranged from 85.8% in Clark County, Nevada, to 96.2% in New Castle, Delaware (Table 9);  $\geq 1$  dose of varicella vaccine ranged from 74.9% in Flathead County, Montana, to 95.0% in Hartford County, Connecticut (Table 10);  $\geq 4$  doses of PCV7 ranged from 57.8% in Hinds County, Mississippi, to 91.0% in Howard County, Maryland ( $\geq 3$  doses also was measured) (Tables 11 and 12);  $\geq 1$  dose of the seasonal influenza vaccine ranged from 22.2% in El Paso County, Texas, to 68.8% in New York County, New York (Table 13); the required number of doses to be up-to-date on the seasonal influenza vaccine ranged from 10.2% in El Paso County, Texas, to 55.7% in New York, New York (Table 14);  $\geq 1$  dose of hepatitis A vaccine ranged from 24.2% in Gallatin County, Montana, to 88.6% in Dona Ana County, New Mexico (Table 15); and  $\geq 2$  doses of hepatitis

A vaccine ranged from 17.5% in Sedgwick County, Kansas, to 47.6% in El Paso County, Texas (Table 16).

## County-Level Trends

During the first and last biennial periods for which James-Stein estimates were available, statistically significant increases in estimated vaccination coverage occurred in 27 of 233 counties (12%) with  $\geq 4$  doses of DTaP; 38 of 233 counties (16%) with  $\geq 3$  doses of polio vaccine; eight of 233 counties (3%) with  $\geq 1$  dose of MMR; nine of 233 counties (4%) with  $\geq 3$  doses of Hib; 193 of 233 counties (83%) with  $\geq 3$  doses of hepatitis B vaccine; 228 of 232 counties (98%) with  $\geq 1$  dose of varicella vaccine; and 187 of 192 counties (97%) with  $\geq 4$  doses of PCV7. For the vaccination series, statistically significant increases occurred in 29 of 233 counties (12%) with 4:3:1; in 30 of 233 counties (13%) with 4:3:1:3; in 159 of 233 counties (68%) with 4:3:1:3:3; in 139 of 213 counties (65%) with 4:3:1:3:3:1; and in 181 of 192 counties (94%) with 4:3:1:3:3:1:4.

In six of 233 counties, statistically significant decreases occurred in the estimated percentage of administered doses or vaccination coverage rate for certain vaccines and vaccine series:  $\geq 4$  doses of the DTaP/DTP vaccine (one county: Collin County, Texas);  $\geq 3$  doses of the Hib vaccine (five counties: Hartford County, Connecticut; Pennington County, South Dakota; King County, Washington; Laramie County, Wyoming; Sweetwater County, Wyoming); the 4:3:1 series (one county: Collin County, Texas); and the 4:3:1:3 series (one county: Collin County, Texas).

## Achievement of *Healthy People 2010* Objectives During 2007–2008

For individual vaccines recommended during the 2007–2008 biennial period, the number of counties that achieved the *Healthy People 2010* objective of 90% coverage for individual vaccines were as follows: 15 of 193 counties (8%) for  $\geq 4$  doses of DTaP (Table 5), 179 of 193 counties (93%) for  $\geq 3$  doses of polio vaccine (Table 6), 166 of 193 counties (86%) for  $\geq 1$  dose of MMR (Table 7), 137 of 193 counties (71%) for  $\geq 3$  doses of Hib (Table 8), 182 of 193 counties (94%) for  $\geq 3$  doses of hepatitis B vaccine (Table 9), 97 of 193 counties (50%) for  $\geq 1$  dose of varicella vaccine (Table 10), and one of 193 counties (<1%) for  $\geq 4$  doses of PCV7 (Table 12). Among the counties that did not achieve the *Healthy People 2010* vaccination coverage objective of 90% coverage for DTaP, the estimated coverage rates ranged from <1 to 9.9 percentage points lower than the coverage objective; for MMR, coverage ranged from <1 to 3.6 percentage points lower than the objective; for Hib,

coverage ranged from <1 to 7.6 percentage points lower than the objective; for hepatitis B vaccine, coverage ranged from <1 to 4.2 percentage points lower than the objective; and for varicella vaccine, coverage ranged from <1 to 9.0 percentage points lower than the objective.

County-level estimates of the 3:3:1 series (Table 17) provide an estimate of what coverage would be in those counties had all children who received 3 doses of DTaP also received the recommended fourth dose. For vaccine series recommended during the most recent 2007–2008 biennial period, the number of counties achieving the *Healthy People 2010* objective of 80% coverage was 151 of 193 counties (77%) for the 4:3:1 series (Table 18), 113 of 193 counties (58%) for the 4:3:1:3 series (Table 19), 77 of 193 counties (40%) for the 4:3:1:3:3 series (Table 20), 30 of 193 counties (16%) for the 4:3:1:3:3:1 series (Table 21), and two of 193 counties (1%) for the 4:3:1:3:3:1:4 series (Table 22). Among the counties that did not achieve the *Healthy People 2010* objective for the 4:3:1 series, vaccination coverage rates ranged from <1 to 9.2 percentage points lower than the coverage objective; for the 4:3:1:3 series, coverage ranged from <1 to 9.2 percentage points lower than the objective; for the 4:3:1:3:3 series, coverage ranged from <1 to 9.5 percentage points lower than the coverage objective; and for the 4:3:1:3:3:1 series, coverage ranged from <1 to 9.8 percentage points below the coverage objective.

## Association of County-Level Factors with Estimated County-Level Vaccination Coverage Rates During 2007–2008

In fitting the forward stepwise regressions to obtain modeled estimates of the log-odds of county-level vaccination coverage rates for the James-Stein estimates, counties with lower estimated vaccination coverage rates had higher per capita persons in poverty, had higher percentages of black children among children aged <5 years, had a higher number of pediatric intensive care beds per capita, were designated as a nonmetropolitan county with an economy dependent on recreation activities, or were designated as experiencing housing stress (Table 2). Counties with housing stress are defined by the U.S. Department of Agriculture Economic Research Service (USDA ERS) as those in which  $\geq 30\%$  of households meet one or more of the following housing conditions: lack of complete plumbing, lack of complete kitchen, pay  $\geq 30\%$  percent of income for owner costs or rent, or more than one person per room (20). In general, counties with higher estimated vaccination coverage rates were designated as having a higher number of pediatricians per capita, having higher per capita income, having a higher number of Hispanic persons per capita, being designated as having a service-dependent economy, or having

a higher number of persons per capita living in group quarters (e.g., college residence halls, residential treatment centers, skilled nursing facilities, group homes, military barracks, correctional facilities, workers' dormitories, and facilities for persons experiencing homelessness) (Table 2).

## Discussion

During 2007–2008, the 193 counties included in this report included 49.0% of the population of children aged 19–35 months in the United States and 106 of the 150 most populous counties. With the exception of the hepatitis A vaccine (for which estimates of county-level vaccination coverage were available for only one biennial period), significant increases in county-level estimated vaccination coverage occurred for all the individual vaccines and vaccine series from the earliest and latest biennial periods for which estimates were available. County-level increases for individual vaccines ranged from 3.6% for MMR to 71.4% for varicella vaccine. The percentage of counties with significant increases in county-level vaccination coverage rates was greater for the more recently recommended vaccines, varicella and PCV7, and for the vaccine series that included varicella vaccine and PCV7. However, significant increases in estimated county-level vaccination coverage rates occurred in a moderate number of counties for individual vaccines that were recommended before 1995.

The *Healthy People 2010* vaccination coverage objective of 90% for individual vaccines was achieved for a majority of the 193 selected counties during the 2007–2008 biennial period for the recommended number of doses for polio, MMR, Hib, hepatitis B, and varicella vaccines. In December 2007, a shortage of the Hib vaccine began and continued until mid-2009 (21,22). Research is underway to evaluate the extent to which Hib coverage decreased during the shortage.

Since licensure of hepatitis A vaccine during 1995–1996, the hepatitis A childhood immunization strategy has been implemented incrementally, beginning with the 1996 recommendation to vaccinate children living in communities with the highest disease rates, continuing in 1999 with recommendations for vaccination of children living in states, counties, and communities with consistently high hepatitis A rates, and culminating in 2006 with the recommendation for routine hepatitis A vaccination of children nationwide (23). *Healthy People 2010* vaccination coverage objectives were not specified for hepatitis A vaccine. However, a vaccination coverage objective of 60% has been proposed for the *Healthy People 2020* objective (24) for national hepatitis A vaccine coverage.

The findings in this report indicate that higher county-level estimated vaccination coverage is associated with greater

access to primary care (e.g., more pediatricians per capita). In addition, high county-level vaccination coverage rates were found to be positively associated with per capita living in group quarters. Because the per capita living in group quarters variable used measures the extent to which a county provides housing, custodial, medical, and other services to residents who live in group quarters, the variable might provide an indirect measure of the extent to which the infrastructure of a county is organized to provide access to other medical services for other county residents (e.g., primary care services to infants). At the county level, per capita income was found to be positively associated with higher vaccination coverage rates. In other research, family income has been found to be a significant predictor of whether individual children have received all recommended childhood vaccines (25,26).

County-level factors associated with lower county-level estimated vaccination coverage include correlates of poverty. In particular, lower county-level vaccination coverage rates were found to be associated with higher levels of housing stress. Because the housing stress variable measures the extent to which  $\geq 30\%$  of the residents in a county live in substandard housing conditions or pay a disproportionate amount of their income for rent or mortgage, the variable can be considered an indicator of county-level poverty. Poverty is significantly correlated with lower levels of vaccination coverage (25,26). In counties where housing stress is pervasive, lower county-level estimates of vaccination coverage among infants are likely (27).

Lower county-level coverage also was associated with a higher number of pediatric intensive care beds per capita. This finding might be a result of counties allocating resources for care at hospitals rather than for primary care at medical facilities where vaccinations are administered.

The Vaccines for Children Program, implemented during 1994, was designed to mitigate the effect of the cost of childhood vaccines by providing vaccines at no cost to children entitled to the program. In 2009, VFC children had vaccination coverage levels that were similar to but slightly below coverage levels attained by fully insured children. However, determining what the coverage level would be without the VFC program is not possible.

Because the data in this report were obtained from a large national survey, the data were pooled for 2 consecutive years, and the James-Stein estimation method was used, precise estimates of vaccination coverage for many counties were obtained, making increasing trends in counties easier to detect with higher statistical power (27). In addition, ACIP definitions were used for up-to-date vaccination status for routine vaccine administration. During a vaccine shortage, ACIP usually suspends its recommendations for the routinely recommended number of

doses and issues interim recommendations that require fewer doses. Therefore, the up-to-date status of children in this report was determined using ACIP routine recommendations that are used when no shortages exist, rather than ACIP interim recommendations that temporarily decrease the number of vaccine doses until a shortage has been resolved.

The findings in this report are subject to at least five limitations. First, NIS has moderate response rates, and nonresponse bias might have resulted in an overestimation of vaccination coverage. However, the statistical methods of NIS (15) are designed to reduce potential nonresponse bias, and some research suggests that the bias in NIS might be small (28). Second, NIS is a survey of children living in households with landline telephones. Therefore, the results in this report might not be generalizable to children who live in households with no telephone service or in households with cellular telephones but no landline. However, recent evidence suggests that bias in surveys that only sample households with landline telephones might be small (29,30). Third, counties with  $\geq 90\%$  vaccination coverage for individual vaccines and  $\geq 80\%$  vaccination coverage for vaccine series were categorized as meeting the *Healthy People 2010* vaccination coverage objectives. In some counties, the results have wide confidence intervals, which indicates that those estimates are less precise. Fourth, because the county coverage estimates for a biennial period are reported only when the sample size during the biennial period is  $\geq 35$ , the number of biennial periods used to track trends in coverage varied from county to county. From two to seven biennial estimates are available to track trends depending on the sample size for each biennial period. Because the number of estimates available for a trend analysis was small, a simple method for evaluating whether coverage had increased or decreased over the time period covered by those biennial estimates was used, in which the two biennial estimates at the beginning and end of that period were compared. Those two biennial estimates do not necessarily correspond to the first and last biennial periods during 1995–2008. As additional years of NIS data become available, more sophisticated trend analyses might be conducted to allow the evaluation of differential trends between counties for the same vaccine and to assess whether vaccination coverage increased at certain points but decreased thereafter. Finally, of the approximately 2,300 of 3,141 counties in the United States that were sampled by NIS during the 2007–2008 biennial period, only 193 counties met the sample size requirement. However, those counties represented approximately 49% of all children aged 19–35 months in the United States, and the estimates of vaccination coverage among children living in all of those counties were very close to the estimated vaccination coverage for the United States. However, a more careful analysis of counties that did not meet

the sample size requirement is merited when sufficient sample size has accrued over time.

A goal of a vaccination program is to maintain a sufficiently high level of vaccination coverage to minimize the effects of vaccine-preventable diseases. The *Healthy People 2010* and *Healthy People 2020* (31) vaccination coverage objectives are milestones toward achieving high levels of vaccination coverage. Those milestones must be achieved in small areas (e.g., counties and communities) to eventually achieve high levels of vaccination coverage for all 50 states and the District of Columbia. Surveillance of vaccination coverage in small geographic areas might be useful for local health authorities to identify areas with low vaccination coverage and in need of policy or program intervention and might further decrease actual and potential morbidity from vaccine-preventable diseases. County estimates from NIS can supplement other local area methods of assessment, including Immunization Information Systems, retrospective school assessment surveys, and area-specific telephone or household surveys. *The Guide to Community Preventive Services* (32) provides a summary of interventions that have been evaluated to increase community vaccination coverage. Interventions that have been found to be effective include provider reminder-recall systems that recall parents to clinics to administer missed doses to children, assessment and feedback for vaccination providers that retrospectively evaluates the performance of providers in delivering one or more vaccinations to a client population, and use of Immunization Information Systems at the point of clinical care and to aid in surveillance and investigations of vaccination coverage (33).

**TABLE 1. (Continued) Counties with vaccination coverage estimates (N = 257), by number of children aged 19–35 months and population rank — United States, 1995–2008**

County/Area	No. of children aged 19–35 months	Population rank*
Spokane, Washington	8,213	151
Thurston, Washington	3,965	294
Whatcom, Washington	3,106	368
Yakima, Washington	5,947	201
Kanawha, West Virginia	3,268	347
Brown, Wisconsin	4,696	255
Dane, Wisconsin	8,606	141
Milwaukee, Wisconsin	20,927	37
Outagamie, Wisconsin	3,263	348
Waukesha, Wisconsin	6,082	198
Albany, Wyoming	523	1,450
Campbell, Wyoming	911	953
Fremont, Wyoming	778	1,077
Laramie, Wyoming	1,810	576
Natrona, Wyoming	1,432	677
Sweetwater, Wyoming	908	957
Uinta, Wyoming	443	1,599

\*Population rank among 3,141 counties in the United States according to the population of children aged 19–35 months as of July 1, 2007. Vaccination coverage was estimated for counties where the sample size of children with sufficient vaccination and health-care provider data from the mailed survey portion of the National Immunization Survey was  $\geq 35$  for the combined survey years during the biennial period and  $\geq 14$  for each year during the biennial period. For each of the 257 counties that met the sample size requirement for at least one biennial period, an averaged estimate over the biennial period was calculated.

TABLE 2. Predictors of low or high vaccination coverage, by vaccine and vaccine series\*

See table footnotes on page 15.

**Abbreviations:** DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; MMR = measles, mumps, and rubella; Hib = *Haemophilus influenzae* type B; PCV7 = 7-valent pneumococcal conjugate vaccine.

\* 3:3:1 = ≥3 doses of DTaP/DTP vaccine, ≥3 doses of polio vaccine, and ≥1 dose of MMR; 4:3:1 = ≥4 doses DTaP/DTP vaccine, ≥3 doses of polio vaccine, ≥1 dose of MMR vaccine; 4:3:1:3 = 4:3:1 plus ≥3 doses Hib vaccine; 4:3:1:3:3 = 4:3:1:3 plus ≥3 doses of hepatitis B vaccine, 4:3:1:3:3:1 = 4:3:1:3:3 plus ≥1 dose of varicella vaccine; 4:3:1:3:3:1.4 = 4:3:1:3:3:1 plus ≥4 doses of PCV7.

† Low indicates that the regression coefficient from the regression of the log odds of the direct estimate on the predictor variable was negative; high indicates that the regression coefficient was positive.

§ U.S. Department of Agriculture Economic Research Service (ERS) economic-dependent 2004 typology codes are available at <http://www.ers.usda.gov/briefing/rurality/typology>.

¶ An area with urban influence is categorized by ERS as 1) a county designated as a metropolitan area with ≥1 million residents, 2) a county designated as a metropolitan area with <1 million residents, 3) a micropolitan area (i.e., an urban area based around a core city or town with a population of 10,000–49,999) adjacent to a large metropolitan area, or 4) a noncore adjacent to a large metropolitan area. Information on the ERS urban influence codes is available at <http://www.ers.usda.gov/Data/UrbanInfluenceCodes>.

\*\* ERS defines counties with housing stress as those in which ≥30% of households meet one or more of the following housing conditions: lack of complete plumbing, lack of complete kitchen, pay ≥30% percent of income for owner costs or rent, or >1 person per room. ERS designations of county-level housing stress are available at <http://www.ers.usda.gov/briefing/rurality/typology/maps/housing.htm>.

†† ERS defines counties with low education as those in which ≥25% of residents aged 25–64 years have neither a high school diploma nor a general educational development (GED) diploma. ERS designations of county-level low education are available at <http://www.ers.usda.gov/briefing/rurality/typology/maps/education.htm>.

§§ ERS defines counties with persistent poverty as those in which ≥20% of residents are poor as measured by each of the previous four censuses: 1970, 1980, 1990, and 2000. ERS designations of county-level persistent poverty are available at <http://www.ers.usda.gov/briefing/rurality/typology/maps/poverty.htm> and [http://www.ers.usda.gov/data/typologycodes/2004/all\\_final\\_codes.xls](http://www.ers.usda.gov/data/typologycodes/2004/all_final_codes.xls).

¶¶ ERS defines population loss (for the year 2000) as counties in which the number of residents decreased both between the 1980 and 1990 censuses and between the 1990 and 2000 censuses. The ERS designations of county-level population loss are available at <http://www.ers.usda.gov/briefing/rurality/typology/maps/population.htm>.

\*\*\* ERS defines nonmetro recreation by a combination of factors, including share of employment or share of earnings in recreation-related industries, share of seasonal or occasional use housing units, and per capita receipts from motels and hotels. ERS designations of nonmetro recreation are available at <http://www.ers.usda.gov/briefing/rurality/typology/maps/recreation.htm>.

††† ERS defines retirement destination counties as those where the number of residents aged ≥60 years increased by ≥15% during 1990–2000 because of immigration. ERS designations of retirement destinations are at <http://www.ers.usda.gov/briefing/rurality/typology/maps/retirement.htm> and [http://www.ers.usda.gov/data/typologycodes/2004/all\\_final\\_codes.xls](http://www.ers.usda.gov/data/typologycodes/2004/all_final_codes.xls).

§§§ **Source:** US Department of Health and Human Services, Health Resources and Services Administration: Area resource file. National county-level health resource information database. Available at <http://www.arfsys.com>.

¶¶¶ The U.S. Census Bureau defines group quarters as a place where persons live or stay that is normally owned or managed by an entity or organization providing housing or services for the residents. These services might include custodial or medical care as well as other types of assistance, and residency is commonly restricted to those receiving these services. Persons living in group quarters are usually not related to each other. Group quarters include college residence halls, residential treatment centers, skilled nursing facilities, group homes, military barracks, correctional facilities, workers' dormitories, and facilities for persons experiencing homelessness. Additional information is available at [http://www.census.gov/acs/www/data\\_documentation/documentation\\_main](http://www.census.gov/acs/www/data_documentation/documentation_main).

**Abbreviations:** DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; CI = confidence interval; NA = not available.

\* Estimate exceeds the *Healthy People 2010* objective of 90% vaccination coverage.

† Estimates increased significantly between the first and last biennial periods ( $p < 0.05$ ).

‡ Estimate has 95% CI half-width that exceeds 10% and might be imprecise.

¶ Estimates decreased significantly between the first and last biennial periods ( $p < 0.05$ ).

Abbreviations: DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; CI = confidence interval; NA = not available.

\* Estimate exceeds the Healthy People 2010 objective of 90% vaccination coverage.

† Estimates increased significantly between the first and last biennial periods (p<0.05).

‡ Estimate has 95% CI half-width that exceeds 10% and might be imprecise.

¶ Estimates decreased significantly between the first and last biennial periods (p<0.05).

**TABLE 7. Estimated vaccination coverage with ≥1 dose of MMR vaccine among children aged 19–35 months, by county/area and biennial survey period — National Immunization Survey, selected counties, United States, 1995–2008**

**Abbreviations:** CI = confidence interval; NA = not available; PCV7 = 7-valent pneumococcal conjugate vaccine.

\* Estimates increased significantly between the first and last biennial periods ( $p < 0.05$ ).

<sup>†</sup> Estimate has 95% CI half-width that exceeds 10% and might be imprecise.

<sup>§</sup> Estimate exceeds the *Healthy People 2010* objective of 90% vaccination coverage.

**Abbreviations:** CI = confidence interval; DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; MMR = measles, mumps, and rubella; NA = not available.

\* ≥3 doses of DTaP/DTP vaccine, ≥3 doses of polio vaccine, and ≥1 dose of MMR vaccine.

† Estimates increased significantly between the first and last biennial periods (p<0.05).

§ Estimate exceeds the *Healthy People 2010* objective of 80% vaccination coverage.

**Abbreviations:** CI = confidence interval; DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; Hib = *Haemophilus influenzae* type B; MMR = measles, mumps, and rubella; NA = not available.

\* ≥4 doses DTaP/DTP vaccine, ≥3 doses of polio vaccine, ≥1 dose of MMR vaccine, ≥3 doses of Hib vaccine, and ≥3 doses of hepatitis B vaccine.

† Estimates increased significantly between the first and last biennial periods ( $p < 0.05$ ).

§ Estimate exceeds the *Healthy People 2010* objective of 80% vaccination coverage.

¶ Estimate has 95% CI half-width that exceeds 10% and might be imprecise.

TABLE 21. (Continued) Estimated vaccination coverage for the 4:3:1:3:3:1 vaccine series\* among children aged 19–35 months, by county/area and biennial survey period — National Immunization Survey, selected counties, United States, 2001–2008

County/Area	2001–2002		2003–2004		2005–2006		2007–2008	
	%	(95% CI)	%	(95% CI)	%	(95% CI)	%	(95% CI)
United States <sup>§</sup>	63.4	(±0.7)	74.6	(±0.7)	76.5	(±0.8)	76.7	(±0.8)
Sample size, no.	45,052		43,308		38,607		35,447	
All selected counties	64.0	(±0.9)	74.5	(±0.9)	76.5	(±0.9)	76.8	(±1.0)
Sample size, no.	29,851		28,845		23,485		20,552	
Range, %	40.7–82.2		60.8–86.9		58.9–86.6		59.3–86.3	

**Abbreviations:** CI = confidence interval; DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; Hib = *Haemophilus influenzae* type B; MMR = measles, mumps, and rubella; NA = not available.

\* ≥4 doses of DTaP/DTP vaccine, ≥3 doses of polio vaccine, ≥1 dose of MMR vaccine, ≥3 doses of Hib vaccine, ≥3 doses of hepatitis B vaccine, and ≥1 dose of varicella vaccine.

† Estimate exceeds the *Healthy People 2010* objective of 80% vaccination coverage.

§ Estimates increased significantly between the first and last biennial periods ( $p < 0.05$ ).

¶ Estimate has 95% CI half-width that exceeds 10% and might be imprecise.

Range, %	11.6–61.5		37.2–74.2		50.9–80.1	

**Abbreviations:** CI = confidence interval; DTaP = diphtheria and tetanus toxoids and acellular pertussis; DTP = diphtheria and tetanus toxoids and pertussis; Hib = *Haemophilus influenzae* type B; MMR = measles, mumps, and rubella; NA = not available; PCV7 = 7-valent pneumococcal conjugate vaccine.

\* ≥4 doses of DTaP/DTP vaccine, ≥3 doses of polio vaccine, ≥1 dose of MMR vaccine, ≥3 doses of Hib vaccine, ≥3 doses of hepatitis B vaccine, ≥1 dose of varicella vaccine, and ≥4 doses of PCV7.

† Estimates increased significantly between the first and last biennial periods ( $p < 0.05$ ).

§ Estimate has 95% CI half-width that exceeds 10% and might be imprecise.

¶ Estimate exceeds the *Healthy People 2010* objective of 80% vaccination coverage.

## Surveillance Summaries

The *Morbidity and Mortality Weekly Report (MMWR)* Series is prepared by the Centers for Disease Control and Prevention (CDC) and is available free of charge in electronic format. To receive an electronic copy each week, visit MMWR's free subscription page at <http://www.cdc.gov/mmwr/mmwrsubscribe.html>. Paper copy subscriptions are available through the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402; telephone 202-512-1800.

Address all inquiries about the *MMWR* Series, including material to be considered for publication, to Editor, *MMWR* Series, Mailstop E-90, CDC, 1600 Clifton Rd., N.E., Atlanta, GA 30333 or to [mmwrq@cdc.gov](mailto:mmwrq@cdc.gov).

All material in the *MMWR* Series is in the public domain and may be used and reprinted without permission; citation as to source, however, is appreciated.

Use of trade names and commercial sources is for identification only and does not imply endorsement by the U.S. Department of Health and Human Services.

References to non-CDC sites on the Internet are provided as a service to *MMWR* readers and do not constitute or imply endorsement of these organizations or their programs by CDC or the U.S. Department of Health and Human Services. CDC is not responsible for the content of these sites. URL addresses listed in *MMWR* were current as of the date of publication.
