National Birth Defects Prevention Month and Folic Acid Awareness Week — January 2017

The Zika virus disease outbreak has led to renewed focus on how some birth defects are caused by infection during pregnancy. “Prevent Infections for Baby’s Protection” is the theme of January 2017’s National Birth Defects Prevention Month. Birth defects are common, costly, and critical, and they affect one in 33 U.S. babies annually (1). Not all birth defects can be prevented, but women can increase their chances of having a healthy baby by reducing their risk for getting an infection during pregnancy.

Women can take the following steps to prevent infections: talk to their health care provider about how they can reduce their risk for infections with viruses such as Zika and congenital syphilis, if they are pregnant or currently planning a pregnancy (2); properly prepare food to avoid illnesses, such as listeriosis (3); protect themselves from insects and animals known to carry diseases, such as Zika and toxoplasmosis (4); and maintain good hygiene to prevent infections, such as cytomegalovirus (5). CDC encourages everyone to join this nationwide effort to raise awareness of birth defects, their causes, and their impact. Additional information is available at <https://www.cdc.gov/ncbddd/birthdefects/prevention-month.html>.

January 8–14, 2017, is National Folic Acid Awareness Week. CDC urges all women who can become pregnant to get 400 μg of folic acid every day to help reduce the risk for serious birth defects of the brain and spine (spina bifida and other neural tube defects) (6). Women can get folic acid from fortified foods or supplements, or both. Additional information about folic acid is available at <http://www.cdc.gov/folicacid>.
