Smoking data guide from the National Center for Health Statistics 1964-92

by Kathleen M. Turczyn, M.P.H., Division of
Epidemiology and Health Promotion

The National Center for Health Statistics (NCHS) is responsible for producing vital and health statistics for the U.S. population. The diversified program of health surveys and inventories includes the compilation of data and statistics on environmental, social, and other health hazards. This guide presents a summary of the NCHS data gathered during the last 27 years on one such hazard—smoking. Some data are on public use data tapes and some are in published reports. The main purposes of this guide are to identify NCHS data on smoking behavior for the research and public health communities and encourage further use of these data bases.

Smoking is defined as the use of cigarettes, cigars, pipes, or other tobacco products. Throughout NCHS surveys, cigarette smoking in the general population has provided the most extensive measure of tobacco use in the United States. Cigarette smokers are generally defined as persons who have smoked 100 or more cigarettes in their lifetime.

The measures of smoking behavior obtained at different times and in different surveys are not always identical or comparable. For example, the measures of smoking cessation from the various surveys have common elements but differ greatly in the level of detail obtained. Therefore, users of this guide are encouraged to review carefully the symbols and footnotes presented with the data descriptors.

In addition to the data on smoking collected in NCHS surveys, NCHS contracted with the Bureau of the Census to collect smoking data in the Current Population Survey in June 1966, August 1967, and August 1968. These data are not available as public use tapes, but results can be found in the following NCHS publications (see guide to symbols on following page): 1966 data—VH 10-59, MVSR 18-9S; 1967 data—MVSR 18-9S; 1968 data—MVSR 18-9S and 19-9S.

For more detailed information about any of the data sets described or for assistance in obtaining the public use data tapes or published reports mentioned, please contact the following office:

Footnotes

1. Type of administration codes:

A. Personal interview.

B. Telephone interview.

C. Mail.

2. References refer to NCHS publications or journals. Questionnaire description references show the complete survey questionnaire. Data analysis references may not be exhaustive.

3. Married to a smoker.

4. Asked of males only.

5. Detailed questions.

6. Smoking supplement has not been linked to core questionnaire.

7. Followup of persons interviewed in Wave I.

8. Questionnaire, smoking supplement, or preliminary findings are available from NCHS.

9. Asked of females only.

10. Smoking regularly.

11. Sample size.

12. Question asked but not as a criterion for being a smoker.

13. Detailed questions about amount smoked in past 7 days.

14. Other smokers in the household.

15. Mail survey of surviving relative or other informant.

16. During year before death.

17. In 3 years before death.

18. Followup of mothers interviewed in 1988 National Maternal and Infant Health Survey.

19. Age of youngest mother in sample (survey sample is based on birth certificates.)

20. Related to pregnancy.
21. Marijuana, hashish, cocaine, or crack.
22. Followup interview of examinees from NHANES I (1970-75). See PHR 98-3.
23. 6,900 subjects received smoking questions at baseline.
24. Cycle V is scheduled for 1992.
25. Brand not ascertained, but persons are asked whether they changed brand in last 2 years.
