National Center for Immunization & Respiratory Diseases

Interim Influenza Vaccine Effectiveness against Inpatient, Emergency Department, and Outpatient Illness in the 2022–23 season

Data from the New Vaccine Surveillance Network (NVSN), Flu and Other Viruses in the Acutely Ill Network (IVY), & VISION Network

Samantha Olson MPH, Nathaniel Lewis PhD, & Mark Tenforde MD PhD

Advisory Committee on Immunization Practices

February 22, 2023

Preliminary results

Three networks to evaluate vaccine effectiveness against laboratory-confirmed influenza-associated outpatient visits, emergency department visits, and hospitalization

2022-2023 Flu Vaccine Effectiveness Methods

Enrollees: Have acute respiratory illness

Dates of enrollment: Fall 2022- Early 2023

Design: Test-negative design

- Comparing vaccination odds among case patients with influenza A confirmed by molecular assay versus control patients testing negative for influenza and SARS-CoV-2
- Vaccination status: receipt of any 2022–23 seasonal flu vaccine according to medical records, immunization registries, claims data, and/or self-report

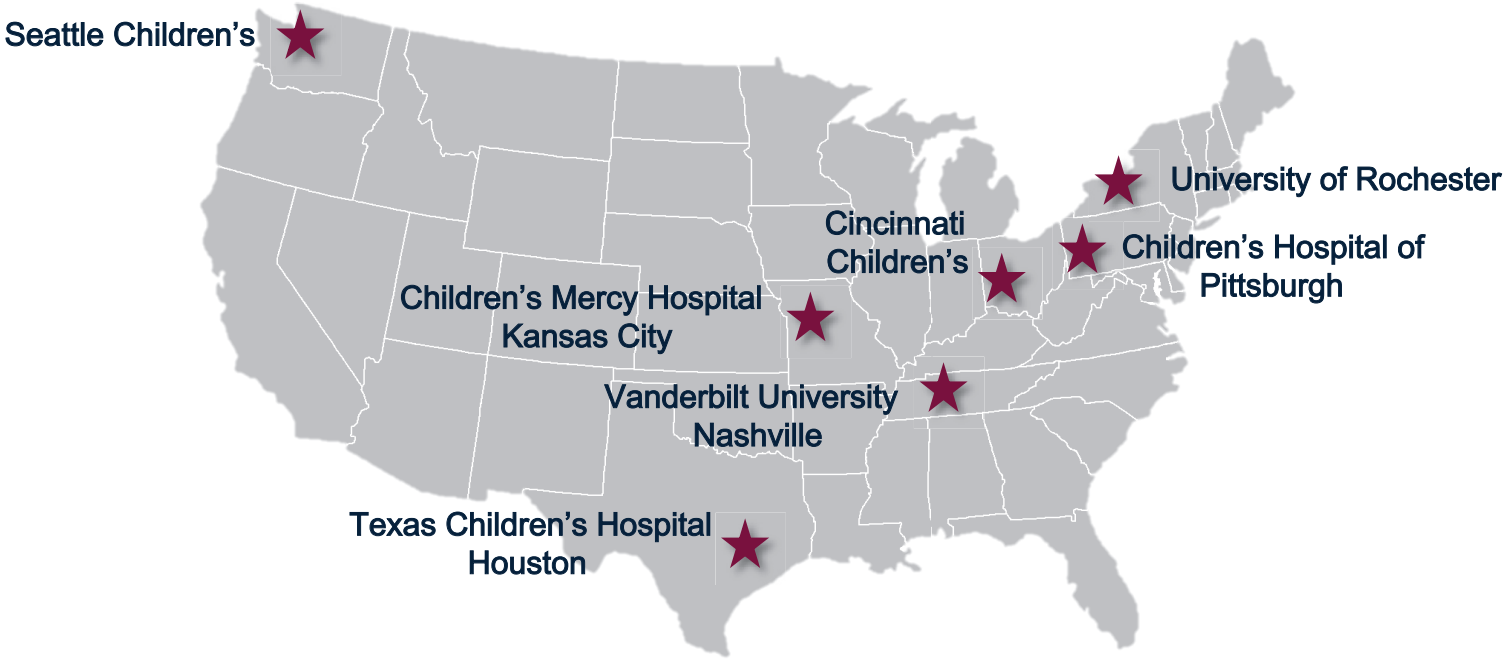
Analysis: VE = (1 – adjusted OR) x 100%

Vaccine effectiveness (VE) against influenza-associated hospitalization and emergency department visits among children aged 6 months – 17 years

New Vaccine Surveillance Network (NVSN)

Preliminary Results

NVSN* Pediatric Inpatient & ED Network sites, 2022-2023



*NVSN-New Vaccine Surveillance Network

NVSN Methods

Enrollees: Inpatient and ED patients aged >6 months to 17 years with acute respiratory illness within 10 days of illness onset

Dates of enrollment: September 13, 2022–January 25, 2023

Design: Test-negative design

- Comparing vaccination odds among case patients with RT-PCR confirmed influenza versus control patients testing negative for influenza and SARS-CoV-2
- Vaccination status: receipt of at least one dose of any 2022–23 seasonal flu vaccine according to medical records, immunization registries, and/or self-report

Analysis: VE = (1 – adjusted OR) x 100%

- Adjustment for site, age, and calendar time of admission

Preliminary Data

Vaccine effectiveness against laboratory confirmed influenza A* in hospital and ED settings, September 13, 2022–January 25, 2023**

	Influenza positive		Influenza negative[1]		Vaccine Effectiveness			
					Unadjusted		Adjusted[2]	
	N vaccinated /Total	(%)	N vaccinated /Total	(%)	VE %	95% CI	VE %	95% CI
Influenza A								
All 6 mos – 17 years	123/640	19	750/2256	33	52	(41 to 62)	**49**	**(36 to 60)**
Inpatient	19/131	15	288/913	32	63	(39 to 78)	**68**	**(46 to 81)**
ED	104/507	21	461/1330	35	51	(38 to 62)	**42**	**(25 to 56)**
A/H3N2	98/478	21	750/2256	33	48	(34 to 59)	**45**	**(29 to 58)**
A/H1N1	23/139	17	750/2256	33	60	(37 to 75)	**56**	**(28 to 72)**

* Of 335 influenza-positive specimens sequenced, 250 were A(H3N2) clade 3C.2a1b.2a.2b and 32 were clade 3C.2a1b.2a.2a.1 and 38 were A(H1N1) clade 6B.1A.5a.2a.1. There were 16 coinfections with Influenza and SARS-CoV-2 that were excluded from the VE estimate.

** Site specific influenza seasons were determined from local influenza activity at each site.

[1] Persons testing negative for both influenza and SARS-CoV-2 using molecular assays.

[2] Multivariable logistic regression models adjusted for site, age, and calendar time.

NVSN

Preliminary interim estimates—NVSN

- Through January 25, 2023, influenza vaccination significantly reduced laboratory confirmed medically attended influenza
  - 68% (95% CI: 46, 81) against pediatric hospitalizations
  - 42% (95% CI: 25, 56) against pediatric ED visits

- Important protection against both A/H3N2 and A/H1N1 associated illness

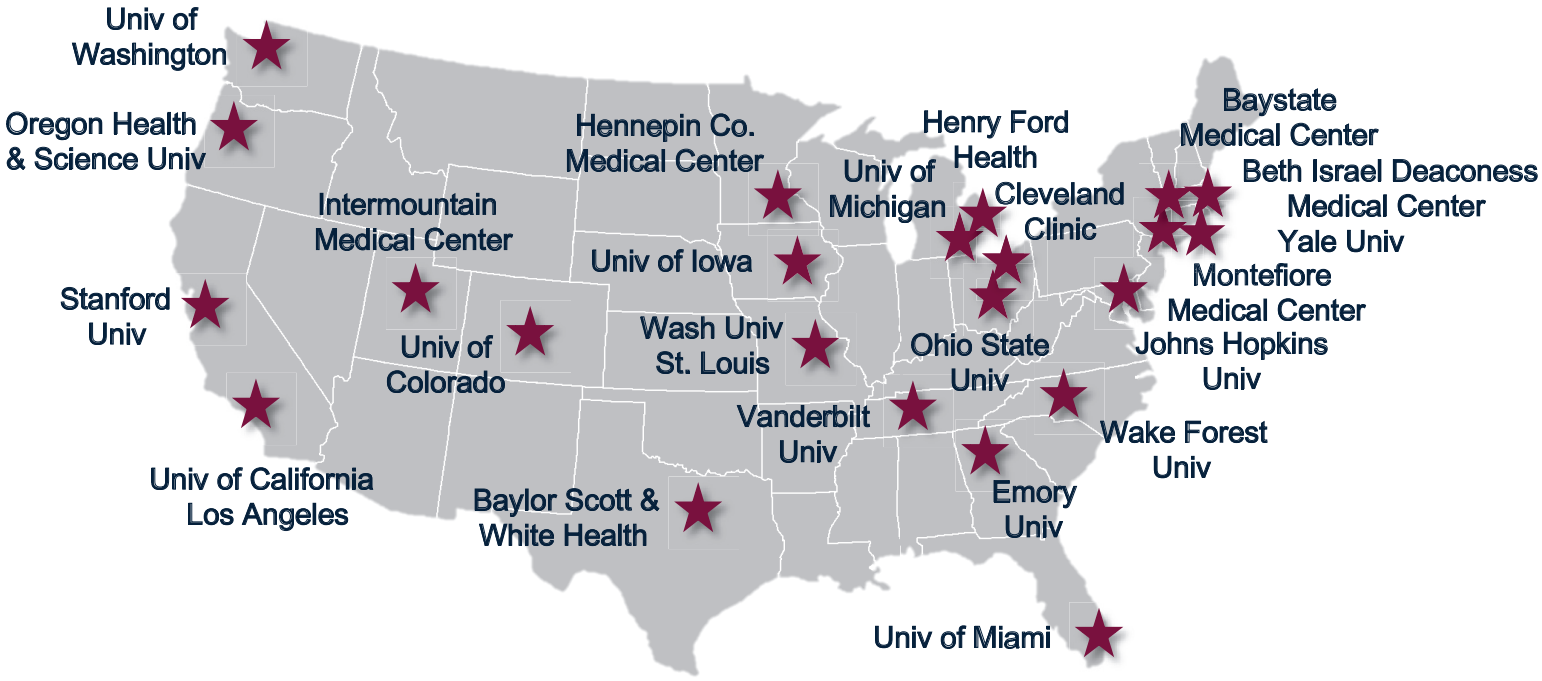
VE against influenza-associated hospitalization among patients aged ≥18 years

Investigating Respiratory Viruses in the Acutely Ill (IVY)

Preliminary Results

IVY* Adult Inpatient Network sites, 2022–2023



*IVY—Investigating Respiratory Viruses in the Acutely Ill

IVY Methods

Enrollees: Inpatient patients aged ≥18 years with acute respiratory illness with fever or cough ≤7 days duration

Dates of enrollment: October 1–December 31, 2022

Design: Test-negative design

- Comparing vaccination odds among influenza RT-PCR positive cases and influenza RT-PCR negative controls, excluding persons testing positive for SARS-CoV-2
- Vaccination status: receipt of at least one dose of any 2021–22 seasonal flu vaccine according to medical records, immunization registries, and/or self-report

Analysis: VE = (1 – adjusted OR) x 100%

- Adjustment for census region, age, sex, race/ethnicity and month of onset

Vaccine effectiveness against laboratory confirmed influenza A* in inpatient settings, October 1, 2022–January 31, 2023

	Influenza positive		Influenza negative[1]		Vaccine Effectiveness			
					Unadjusted		Adjusted[2]	
	N vaccinated /Total	(%)	N vaccinated /Total	(%)	VE %	95% CI	VE %	95% CI
≥18 years	219/701	31	921/2130	43	40	(29 to 50)	**43**	**(30 to 54)**
18–64 years	84/378	22	365/1021	36	49	(33 to 61)	**51**	**(33 to 64)**
≥65 years	135/323	42	556/1109	50	29	(8 to 44)	**35**	**(13 to 52)**
Immunocompromised[3]	45/122	37	238/474	50	42	(13 to 62)	**44**	**(10 to 66)**

* Of 77 influenza-positive specimens sequenced, 50 were A(H3N2) clade 3C.2a1b.2a.2. and 27 were A(H1N1) clade 6B.1A.5a.2. A total of 45 influenza/SARS-CoV-2 coinfections were excluded from the VE estimate

[1] Persons testing negative for influenza and SARS-CoV-2 using molecular assays.

[2] Multivariable logistic regression models adjusted for Census region, age, sex, race/ethnicity, and month.

[3] Includes active solid-organ cancer, active hematologic cancer, solid-organ transplant, bone marrow/stem cell transplant, HIV infection, congenital immunodeficiency syndrome, use of an immunosuppressive medication within the past 30 days, splenectomy, graft-versus-host disease (currently or in the past), or any other condition that causes moderate or severe immunosuppression.

IVY

Preliminary interim estimates—IVY

- Through January 31, 2023, influenza vaccination significantly reduced laboratory confirmed medically attended influenza
  - 43% (95%CI: 30% to 54%) against adult hospitalizations

- Important protection among adults aged 18-64 and ≥65 years, and immunocompromised adults

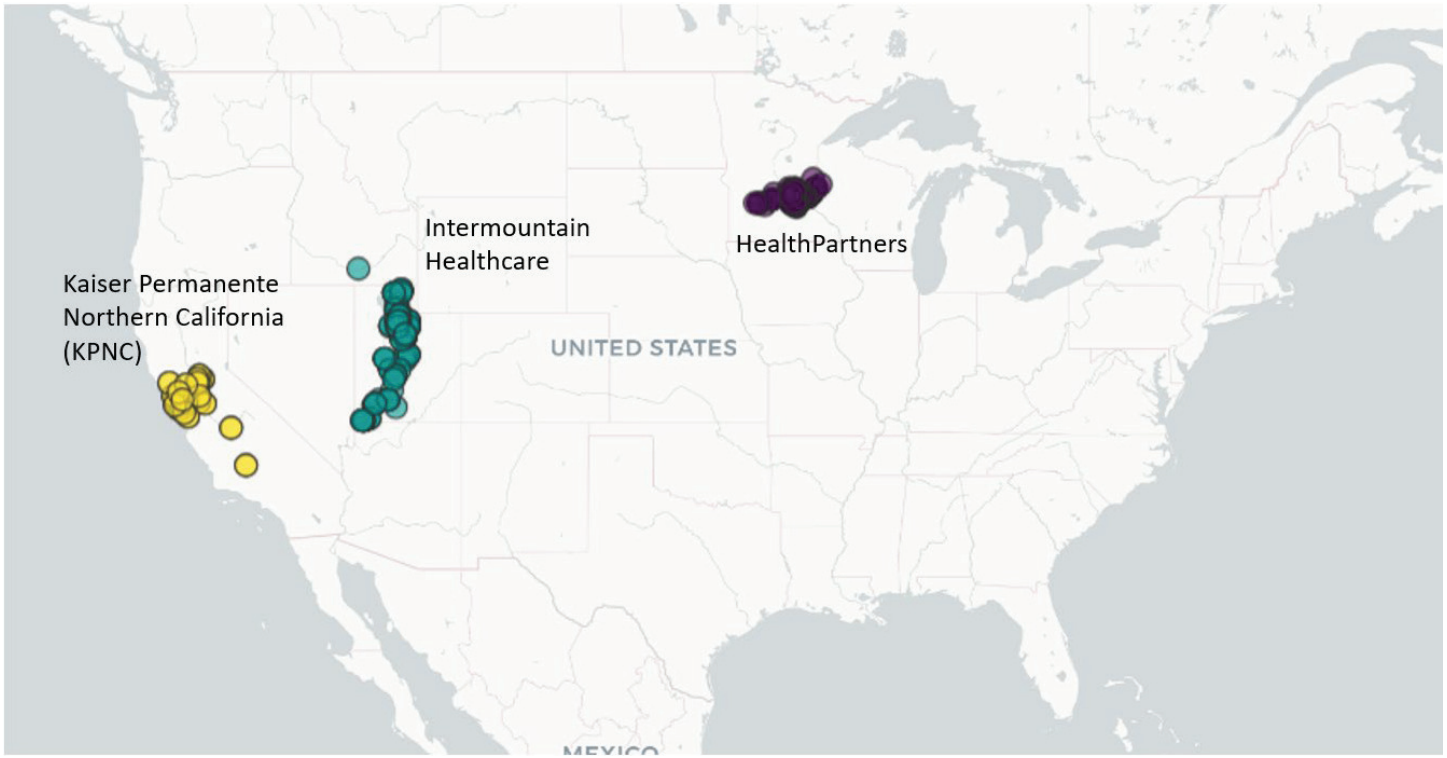
Influenza vaccine effectiveness (VE) against influenza-associated hospitalization and emergency department / urgent care visits among adults aged ≥18 years

VISION Network

Preliminary Results

VISION Network sites, 2022-2023



VISION Methods

Encounters: ED/UC or inpatient encounters among adults ≥18 years tested for influenza and with ≥1 acute respiratory illness (ARI)-associated ICD-10 discharge code

Dates: October 15, 2022–January 24, 2023

Design: Test-negative design

- Comparing vaccination odds among patients with influenza A confirmed by molecular assay versus controls who tested negative for influenza and SARS-CoV-2
- Vaccination status: receipt of any 2022–23 seasonal flu vaccine ≥14 days before index date according to medical records, immunization registries, claims data

Analysis: VE = (1 – adjusted OR) x 100%

- Inverse-propensity-to-be-vaccinated weights and adjustment for patient age, study site, and calendar time

Vaccine effectiveness against laboratory confirmed influenza A in ED/UC settings, October 15, 2022–January 24, 2023*

	Influenza positive		Influenza negative		Vaccine Effectiveness			
					Unadjusted		Adjusted[1]	
	N vaccinated /Total	(%)	N vaccinated /Total	(%)	VE %	95% CI	VE %	95% CI
All adults ≥18 years	3278/14011	(23)	15752/43196	(36)	47	(44 to 49)	**44**	**(41 to 47)**
18-64 years	1600/10590	(15)	6695/27545	(24)	45	(41 to 48)	**46**	**(42 to 49)**
≥65 years	1678/3421	(49)	9057/15651	(58)	30	(25 to 35)	**39**	**(34 to 43)**
Immunocompromised[2]	64/179	(36)	553/1363	(41)	18	(-13 to 41)	**30**	**(-2 to 52)**

* Site specific influenza seasons were determined when local influenza activity was seen at site on or after October 15, 2022, and end date was the date of last available encounter.

[1] Adjusted for patient age, study site, and calendar time.

[2] Defined as at least one discharge diagnosis for solid malignancy, hematologic malignancy, rheumatologic or inflammatory disorder, other intrinsic immune condition or immunodeficiency, or organ or stem cell transplant.

Vaccine effectiveness against laboratory confirmed influenza A in Hospital settings, October 15, 2022–January 21, 2023*

	Influenza positive		Influenza negative		Vaccine Effectiveness			
					Unadjusted		Adjusted[1]	
	N vaccinated /Total	(%)	N vaccinated /Total	(%)	VE %	95% CI	VE %	95% CI
All adults ≥18 years	671/1760	(38)	4561/9377	(49)	35	(28 to 41)	**39**	**(31 to 45)**
18-64 years	146/623	(23)	802/2739	(29)	26	(9 to 40)	**29**	**(12 to 43)**
≥65 years	525/1137	(46)	3759/6638	(57)	34	(25 to 42)	**42**	**(34 to 49)**
Immunocompromised[2]	130/297	(44)	1172/2316	(51)	24	(3 to 40)	**31**	**(10 to 48)**

* Site specific influenza seasons were determined when local influenza activity was seen at site on or after October 15, 2022, and end date was the date of last available encounter.

[1] Adjusted for patient age, study site, and calendar time.

[2] Defined as at least one discharge diagnosis for solid malignancy, hematologic malignancy, rheumatologic or inflammatory disorder, other intrinsic immune condition or immunodeficiency, or organ or stem cell transplant.

Preliminary interim estimates—VISION

- Through January 2023, influenza vaccination significantly reduced laboratory confirmed medically attended influenza
  - 39% (95%CI: 31, 45) against adult hospitalizations
  - 44% (95%CI: 41, 47) against adult ED or UC visits
  - VE observed across age group and immunocompromised

- Estimates higher than VE estimates against hospitalization (25%) and ED or UC visits (25%) from the 2021–22 season at the same VISION sites

- Limitations include lack of VE by influenza A subtype

Discussion

Summary of Three Flu VE Networks

- Across three Flu VE platforms, we observed **consistent influenza vaccine effectiveness** during the 2022-2023 season.

- Influenza **vaccination provided substantial protection** against inpatient, emergency department, and outpatient illness **among all ages**.

- Influenza **vaccination provided substantial protection among important high-risk groups** (ages 65+ and immunocompromised).
